ALGORITHM FOR DETERMINING THE MINIMUM VALUE OF ALL SUBGRAPHS WITH k VERTICES

Paul VASILIU[1]

[1]Lecturer Ph.D. Eng. Department of Electrical Engineering and Electronics, „Mircea cel Batran" Naval Academy

Abstract:*In this paper we will prove how all subgraphs with k vertices and weighted edges of a graph can be generated and how can be computed the minimum value of all subgraphs with k vertices. "The paper will include a written C++ program that implements the presented algorithm. Moreover, a use case scenario for this algorithm will be described" [1].*

Keywords*: graph, subgraph, compute, algorithm, program*

INTRODUCTION

"Let it be $X=\{x_1,x_2,\cdots,x_n\}$ the set of vertices, we have the application $\Gamma: X \to P(X)$and the graph $G=(X,\Gamma)$. Let it be $A=(a_{ij})_{\substack{i=1,2,\cdots,n\\ j=1,2,\cdots,n}}$ with the elements $a_{ij}=\begin{cases}1 & if \quad x_j \in \Gamma(x_i)\\ 0 & if \quad x_j \notin \Gamma(x_i)\end{cases}$ the adjacency matrix of graph $G=(X,\Gamma)$.

Let it be $U=\{(x_i,x_j)|x_j \in \Gamma(x_i)\}$ the set of edges of the graph. Let us assume that the graph has weighted edges $l(x_i,x_j)$ with values greater than 0 for every $(x_i,x_j) \in U$" [1].

We define as value of the graph $G=(X,\Gamma)$, the number $l(G)=\sum_{(x_i,x_j)\in U} l(x_i,x_j)$.

Let it be $X'=\{x_{i_1},x_{i_2},\cdots,x_{i_k}\} \subset \{x_1,x_2,\cdots,x_n\}$ the subset, not null, of vertices of set X.

Let it be $\Gamma': X' \to P(X')$ the application defined $\Gamma'(x_{i_p})=\Gamma(x_{i_p}) \cap X'$, by for every $x_{i_p} \in X'$. Pair $G'=(X',\Gamma')$ is called the subgraph of the graph $G=(X,\Gamma)$ defined by the set of vertices X'.

Let it be $U'=\{(x_i,x_j)|x_j \in \Gamma'(x_i)\}$ the set of edges of the subgraph $G'=(X',\Gamma')$.

Let it be defined the number $l(G')=\sum_{(x_i,x_j)\in U'} l(x_i,x_j)$for the subgraph $G=(X,\Gamma)$.

In this paper we will prove how can be generated all the subgraphs of k vertices of a given graph and how their values can be computed.

We will also determine the minimum value of all subgraphswith $k$vertices.

We will present a program written in C++, that receives as input a graph and the number k, representing the number of vertices. The program generates all the subgraphs defined by k vertices and their values, and then determine the minimum value of all subgraphs.

ALGORITHM

In this section, we will show how can be generated all the subgraphs defined by k vertices of a given graph and also, how the values for the subgraphs are computed.

For this purpose, we generated through backtracking all the subsets of k distinct elements of the set $\{1,2,\cdots,n\}$in which the order does not matter. In other words, we generated all the combinations of k elements of set $\{1,2,\cdots,n\}$. All these subsets are saved in a file named sg.txt. The elements of each subset $\{i_1,i_2,\cdots,i_k\}$ represent the indexes of the subgraph vertices that will be generated and which value will be computed. The value of the subgraph $G'=(X',\Gamma')$ defined by the vertices $x_{i_1},x_{i_2},\cdots,x_{i_k}$equals to $l(')=\sum_{(x_i,x_j)\in U'} l(x_i,x_j)$.

Subsets are extracted successively from file sg.txt. For each subset $\{i_1,i_2,\cdots,i_k\}$ has generated the graph defined by vertices $x_{i_1},x_{i_2},\cdots,x_{i_k}$ and computed its value.

When generating each subgraph, we take into consideration the adjacency matrix $A'$of the subgraph $G'=(X',\Gamma')$, can be obtained from the adjacency matrix $A$of graph $G=(X,\Gamma)$ keeping the rows and columns with indexes $i_1,i_2,\cdots,i_k$ and canceling all the rows and columns from matrix A with indexes $i \notin \{i_1,i_2,\cdots,i_k\}$.

Sgval.txt text file have stored all subgraphs and their values. It then reads this file and determines the minimum value of all subgraphs.

IMPLEMENTATION

"Below we present the program written in C++ that implements the described algorithm.

The program receives as input the text file associated with the graph $G=(X,\Gamma)$, the number

DOI: 10.21279/1454-864X-16-I2-087

of vertices and the vertices $x_{i_1}, x_{i_2}, \dots, x_{i_k}$ of the subgraph that will be generated “ [1].
The program outputs the number of vertices, the number of edges, the adjacency matrix, the edges of graph $G = (X, \Gamma)$and all subgraphs of the minimum value.
For the subgraph $G' = (X', \Gamma')$ we display the adjacency matrix, the edges of the subgraph and value respectively subgraph.

AN EXAMPLE

Let us consider the directed graph $G=(X,\Gamma)$, with weighted edges, definied by the set of vertices $X=\{x_1,x_2,x_3,x_4,x_5,x_6\}$and the application $\Gamma: X \to P(X)$ definied by the equalities:$\Gamma(x_1)=\{x_1,x_3,x_5,x_6\}$,
$\Gamma(x_2)=\{x_1,x_4,x_5\}$, $\Gamma(x_3)=\{x_2,x_4,x_5,x_6\}$,
$\Gamma(x_4)=\{x_2,x_3,x_6\}$,
$\Gamma(x_5)=\{x_1,x_3,x_4,x_6\}$,$\Gamma(x_6)=\{x_2,x_3,x_5\}$.
Edges values are given in Table 1:

Edge	Value	Edge	Value
(x_1,x_1)	3	(x_4,x_2)	4
(x_1,x_3)	3	(x_4,x_3)	6
(x_1,x_5)	2	(x_4,x_6)	3
(x_1,x_6)	3	(x_5,x_1)	2
(x_2,x_1)	5	(x_5,x_3)	1
(x_2,x_4)	3	(x_5,x_4)	9
(x_2,x_5)	6	(x_5,x_6)	1
(x_3,x_2)	4	(x_6,x_2)	3
(x_3,x_4)	7	(x_6,x_3)	4
(x_3,x_5)	1	(x_6,x_5)	2
(x_3,x_6)	2		

Table 1 Edges values

The adjacency matrix of the graph $G=(X,\Gamma)$is:

$$A=\begin{pmatrix} 1 & 0 & 10 & 1 & 1 \\ 1 & 0 & 01 & 1 & 0 \\ 0 & 1 & 01 & 1 & 1 \\ 0 & 1 & 10 & 0 & 1 \\ 1 & 0 & 11 & 0 & 1 \\ 0 & 1 & 10 & 1 & 0 \end{pmatrix}.$$

"The program read as input a text file with name graph.txt The file has on the first line the number n, representing the number of vertices, and the number m, representing the number of edges separated by one blank space. On the next m lines, we find the edges of the subgraphand their values. For each graph from our example, the input file graph.txt is the following:" [1]

The edge 9: (x6 , x3) of value 4
The edge 10: (x6 , x5) of value 2

The value of the subgraph is 36

Number of subgraphs with 4 vertices = 15

The minimum value is 24

The subgraph { 1 2 4 6 } has minimum value 24
The subgraph { 1 3 5 6 } has minimum value 24
The subgraph { 2 3 5 6 } has minimum value 24

"This execution example of the program highlights the correctness of the obtained theoretical results but also the correctness of the results obtained by the program" [1].

CONCLUSIONS

"In this paper, we have presented an algorithm and a program written in C++ for generating all the subgraphs defined by k gave vertices of a given graph with weighted edges. Furthermore, we computed the values of these subgraphs" [1] and the minimum value of all subgraphs with k vertices.

DOI: 10.21279/1454-864X-16-I2-087

From the large spectrum of future work we will enumerate:

- determining the number of vertices of the subgraphs maximum value;
- determining the number of vertices of the subgraphs minimumvalue.
